

ABSTRACT

[0103] The present invention relates to a system or method for printing, within a user network, a label to be used for the return of a component. The system comprises an appliance connected to the user network. The appliance itself includes at least one removable component, the component being provided with a first memory means containing information for the identification of the removable component. The appliance further comprises a first means to detect a condition relating to the end of lifetime of at least one of the removable components located in the appliance. The system also comprises a second means, which is connected to the user network and is adapted to communicate, through a second network, with at least one remote server. The second means is adapted to send the remote server a request to receive data representing a label to be used for the return of a component, when the condition regarding the end of lifetime of the component located within the appliance has been detected by the first means. The request comprises the information for the identification of the component.
